INTERIM RECOVERY PLAN NO. 331

CINNAMON SUN ORCHID

(*Thelymitra dedmaniarum*)

INTERIM RECOVERY PLAN

2013–2017

January 2013
Department of Environment and Conservation
Kensington
Interim Recovery Plans (IRPs) are developed within the framework laid down in Department of Conservation and Land Management (CALM) Policy Statements Nos. 44 and 50. Note: the Department of CALM formally became the Department of Environment and Conservation (DEC) in July 2006. DEC will continue to adhere to these Policy Statements until they are revised and reissued.

These plans outline the recovery actions that are required to urgently address those threatening processes most affecting the ongoing survival of threatened taxa or ecological communities, and begin the recovery process.

DEC is committed to ensuring that Threatened taxa are conserved through the preparation and implementation of Recovery Plans (RPs) or IRPs, and by ensuring that conservation action commences as soon as possible and, in the case of Critically Endangered taxa, always within one year of endorsement of that rank by the Minister.

This plan, which results from a review of, and replaces IRP No. 45 Cinnamon Sun Orchid (Thelymitra manginii ms) 1999-2002, will operate from January 2013 to December 2017 but will remain in force until withdrawn or replaced. It is intended that, if the taxon is still ranked as Critically Endangered in WA, this plan will be reviewed after five years and the need for further recovery actions assessed.

This plan was given regional approval on 10th October 2012 and was approved by the Director of Nature Conservation on 30th January 2013. The provision of funds identified in this plan is dependent on budgetary and other constraints affecting DEC, as well as the need to address other priorities.

Information in this plan was accurate at January 2013.

PLAN PREPARATION

This plan was prepared by Robyn Luu¹ and Andrew Brown².

¹ Project Officer, DEC Species and Communities Branch, Locked Bag 104, Bentley Delivery Centre, WA 6983.
² Threatened Flora Coordinator, DEC Species and Communities Branch, Locked Bag 104, Bentley Delivery Centre, WA 6983.

ACKNOWLEDGMENTS

The following people provided assistance and advice in the preparation of this plan:

Karen Bettink Ecologist, DEC Swan Region
Kevin Bryant WAPC
Alex Errington Project Officer, Land Tenure Project, DEC.
Anne Harris Flora Conservation Officer, DEC Swan Coastal District
Robert Huston Nature Conservation Leader, DEC Perth Hills District
Belinda Newman Botanic Gardens and Parks Authority
Catherine Page Flora Conservation Officer, DEC Perth Hills District
Ryan Phillips Research Scientist, Botanic Gardens and Parks Authority
Mia Podesta Ecologist – TEC database, DEC Species and Communities Branch

Thanks also to the staff of the W.A. Herbarium for providing access to Herbarium databases and specimen information.

CITATION

### SUMMARY

**Scientific name:** *Thelymitra dedmaniarum*  
**Family:** Orchidaceae  
**DEC region:** Swan  
**Shires:** City of Swan, Gingin  
**IBRA region:** Jarrah Forest, Swan Coastal Plain  
**IBRA subregion:** Northern Jarrah Forest, Perth

<table>

The criteria for success in the previous plan (the number of individuals within populations and/or the number of populations have increased) has been met with an additional four subpopulations located. The majority of recovery actions in the plan have been fully or partially implemented.

**Distribution and habitat:** *Thelymitra dedmaniarum* is known from three areas northeast of Perth, two northwest of Gidgegannup and one north-west of Gingin. The species is found in open *Eucalyptus wandoo* (wandoo) and *E. accedens* (powderbark wandoo) woodlands. Soil is red-brown sandy-loam associated with dolerite and granite outcrops (Jeanes 2006).

**Habitat critical to the survival of the species, and important populations:** *Thelymitra dedmaniarum* is ranked CR in WA and it is considered that all known habitat for wild populations is habitat critical to the survival of the species, and that all wild populations are important populations. Habitat critical to the survival of *T. dedmaniarum* includes the area of occupancy of populations, areas of similar habitat surrounding and linking populations, additional occurrences of similar habitat that may contain undiscovered populations or be suitable for future translocations, and the local catchment for the surface and/or groundwater that maintains the habitat of the species.

**Conservation status:** *Thelymitra dedmaniarum* is declared as rare flora (DRF) under the Western Australian Wildlife Conservation Act 1950 and is ranked as Critically Endangered (CR) in WA under International Union for Conservation of Nature (IUCN 2001) criteria B1ab(i,ii,iii,v); C2a(i); D. The species is listed as Endangered (as *T. manginii* ms) under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act).

**Threats:** The main threats to the species are weed invasion, grazing and trampling, road, track and firebreak maintenance, changed fire regimes, motorbikes and off road vehicles, illegal picking, poor recruitment and future mining operations.

**Existing recovery actions:** The following recovery actions have been or are currently being implemented:

1. Stakeholders have been made aware of the existence of this species and its locations.
2. Declared Rare Flora (DRF) markers have been installed at Subpopulations 1b and g.
4. Between 2001 and 2003 feral pig baiting and trapping was undertaken adjacent to Population 1 by DEC staff with volunteer assistance.
5. Once-off hand application of 1080 rabbit baits were distributed in the area of all private property populations by the Department of Agriculture.
6. In 2002 eight animal exclusion cages were placed over *Thelymitra dedmaniarum* at Subpopulation 1a to prevent digging.
7. An information sheet for the species was produced with funding from the former Natural Heritage Trust and DEC.
8. An article on the range extension of *Thelymitra dedmaniarum* appeared in WATSNU.
9. The Botanic Gardens and Parks Authority (BGPA) have two fungal collections for this species in storage as part of their orchid fungal collection, and two seed collections with each vial containing 0.12mL of seed equaling approximately 2,000 seeds per vial. A further seed collection is kept in the glasshouse and contains 0.20mL of seed which is equivalent to approximately 4000 to 5000 seeds. Two live specimens are potted in the orchid nursery.
10. DEC research associate Fred Hort has undertaken extensive searches for *Thelymitra dedmaniarum*.
11. In 1997 BGPA undertook a research translocation of five species of temperate terrestrial orchids which included the successful establishment of *Thelymitra dedmaniarum*.
12. Staff from DEC Perth Hills and Swan Coastal Districts monitor known populations.
13. The SRTFCRT is assisting DEC to coordinate recovery actions for *Thelymitra dedmaniarum* along with other threatened species in the Region. Information on progress in implementing recovery actions is included in annual reports to DEC’s Corporate Executive and funding bodies.
Objective: The objective of this plan is to abate identified threats and maintain or enhance in situ populations to ensure the long-term preservation of the species in the wild.

Recovery criteria

Criteria for success: The number of populations has increased and/or the number of mature individuals has increased by 20 per cent or more over the term of the plan.

Criteria for failure: The number of populations has decreased and/or the number of mature individuals has decreased by 20 per cent or more over the term of the plan.

Recovery actions

1. Coordinate recovery actions
2. Monitor populations
3. Undertake weed control
4. Install cages and fencing where required
5. Control feral animals that impact on the species
6. Develop and implement a fire management strategy
7. Manage recreational impacts at Subpopulations 1h and 2d
8. Undertake surveys
9. Ensure long term protection of habitat
10. Obtain biological and ecological information
11. Collect and store seed
12. Liaise with land managers and indigenous communities
13. Map habitat critical to the survival of Thelymitra dedmaniarum
14. Promote awareness
15. Review this plan and assess the need for further recovery actions
1. BACKGROUND

The criteria for success in the previous plan (the number of individuals within populations and/or the number of populations have increased) has been met with an additional four subpopulations located. With the exception of translocation and the preparation of a full recovery plan, recovery actions in the previous plan have now been fully or partially implemented. Their current status is listed in table 1.

Table 1: Status of recovery actions included in previous plan

<tr>
<td>Undertake weed control</td>
<td>100% complete</td>
<td>Spot hand spraying of annual grasses (veldt) and wild oats with Fusilade® (2001-2002).</td>
</tr>
<tr>
<td>Determine techniques to control diggings</td>
<td>100% complete</td>
<td>Pig trapping along creek line. In 2002, 8 cages were placed over known locations in pop 1a as a barrier to digging bandicoots.</td>
</tr>
<tr>
<td>Develop a fire management strategy</td>
<td>20% complete</td>
<td>DEC has no specific Fire Management Plan for this species. The City of Swan’s Fire Prevention Plan includes firebreak construction regulations. The land manager of subpopulation 1a maintains firebreaks and carries out hazard reduction burns.</td>
</tr>
<tr>
<td>Promote awareness</td>
<td>Ongoing</td>
<td>A colour information flyer was produced and distributed. A draft revision of the flyer has been produced to include nomenclatural update. Flyer is intended to be distributed to the local Shire and landowners.</td>
</tr>
<tr>
<td>Monitor populations</td>
<td>100% complete</td>
<td>DEC’s flora conservation officer has opportunistically monitored the populations during the term of the plan. Population data has been collected where monitored. All information has been stored at DEC’s Perth Hills District and SCB.</td>
</tr>
<tr>
<td>Collect seed and cutting material</td>
<td>Ongoing</td>
<td>Botanic Gardens and Parks Authority (BGPA) have five seed collections in cryostorage and mycorrhizal isolations. Two live specimens are potted in the orchid nursery. Seeds have been collected for the Millennium Seed Bank Project.</td>
</tr>
<tr>
<td>Control feral animals</td>
<td>100% complete</td>
<td>Pig baiting and trapping was implemented in 2001-2003 with volunteer assistance. Once off hand application of 1080 rabbit baits on all private property populations by Department of Agriculture.</td>
</tr>
<tr>
<td>Conduct further surveys</td>
<td>100% complete</td>
<td>The species has been extensively and opportunistically surveyed for in areas of suitable habitat on private properties and in nature reserves near Gidgegannup. Four new subpopulations have been discovered.</td>
</tr>
<tr>
<td>Obtain biological and ecological</td>
<td>Started, ongoing</td>
<td>BGPA has conducted germination and propagation trials in field sites.</td>
</tr>
<tr>
<td>Liaise with relevant land managers</td>
<td>100% complete</td>
<td>Appropriate authorities and land managers have been notified of the existence of the species and where it occurs (City of Swan and private property owners).</td>
</tr>
<tr>
<td>Propagate plants for translocation</td>
<td>Started, ongoing</td>
<td>BGPA have attempted to propagate plants from tissue culture and seeds. Trials and research is ongoing.</td>
</tr>
<tr>
<td>Start translocation process</td>
<td>0% complete</td>
<td>A translocation proposal was not prepared during the term of the plan. However, in 1997 BGPA conducted experimental translocation trials prior to plan commencement. This action is no longer required due to an improvement in tenure security with a new population located in a Nature Reserve.</td>
</tr>
<tr>
<td>Monitor translocation</td>
<td>0% complete</td>
<td>A translocation proposal was not prepared and implemented.</td>
</tr>
<tr>
<td>Write full Recovery Plan</td>
<td>0% complete</td>
<td>DEC does not generally produce full recovery plans for flora and current interim recovery plans have been extended to a five year term.</td>
</tr>
</tbody>
</table>

The majority of the recovery actions included in the previous plan have been fully or partially implemented. Action 13 Start translocation process, is no longer required due to an improvement in tenure security with a new population located in a Nature Reserve. Action 15 Develop a full Recovery Plan, is redundant as DEC does not generally produce full recovery plans for flora and current interim recovery plans have been extended to a five year term. Ongoing recovery actions included in the previous plan are included in this revised plan.
New recovery actions in this plan are:

Action 4  Install cages and fencing where required. This replaces the previous Action 3.
Action 7  Manage recreational impacts at subpopulations 1h and 2d.
Action 9  Ensure long term protection of habitat.
Action 13 Map habitat critical to the survival of *Thelymitra dedmaniarum*.
Action 15 Propose ranking criteria change.
Action 16 Review this plan and assess the need for further recovery actions.

**History**

The type specimen of *Thelymitra dedmaniarum* was collected from the Toodyay area by Mrs and Miss Dedman in November 1934, and the species was named in their honour by Richard Rogers in 1938. The orchid was not seen again until collected near Gidgegannup in 1987.

There has been some confusion about the delimitations of the taxon. Alex George created the new combination *T. fuscolutea* var. *stellata* (with *T. stellata* reduced to varietal rank and *T. dedmaniarum* [as *T. dedmanae*] reduced to synonymy therein). Following his study of Australian orchid types, Mark Clements again recognised *T. benthamiana*, *T. fuscolutea* and *T. stellata* as distinct species while relegating *T. dedmaniarum* (as *T. dedmanae*) to synonymy under *T. stellata*. Hoffman and Brown (1992) followed Clements in recognising *T. benthamiana*, *T. fuscolutea* and *T. stellata* as distinct species, but also reinstated *T. dedmaniarum* (as *T. dedmanae*) as a species following its recent rediscovery. Hoffman and Brown (1998) again recognised *T. benthamiana*, *T. fuscolutea*, *T. stellata* and *T. dedmaniarum* (this time with the name incorrectly applied to specimens found in 1996 during surveys southwest of York (now described as *Thelymitra yorkensis*)) while recognising *Thelymitra* aff. *dedmaniarum* (the true *T. dedmaniarum*, and later to become incorrectly known informally as *Thelymitra manginii* ms and subsequently *Thelymitra manginiorum* ms) (Jeanes 2006).

In 1999, *Thelymitra dedmaniarum* was known from just two populations near Gidgegannup. A survey undertaken by DEC Swan Coastal District staff in 2009 located a third population at a nature reserve, north of Gingin. Currently, *T. dedmaniarum* is known from three populations together comprising around 40 flowering plants.

**Description**

The name *Thelymitra* is derived from the Greek *Thelys*, feminine and *mitra*, a turban or head dress, and refers to the hooded column of all species. Species of *Thelymitra* are known as Sun Orchids because their flowers remain closed at night or during cool, cloudy weather and open only on warm sunny days when there is little wind (Brown *et al.* 2008).

The distinguishing features of *Thelymitra dedmaniarum* include a sepal length of 12 to 28mm; mostly golden yellow perianth, which is often reddish brown towards the base; yellow or orange column apex; markedly clavate supra-anther lobe; rugose and bilobed supra-anther lobe apex; anther beak 2.5 to 3.5mm by c. 2mm; and cinnamon-like scent (Jeanes 2006).

**Illustrations and/or further information**

**Distribution and habitat**

*Thelymitra dedmaniarum* is known from three populations northeast of Perth (two northwest of Gidgegannup and one northwest of Gingin). The species is found in open *Eucalyptus wandoo* and *E. accedens* woodlands. Soil is red-brown sandy-loam associated with dolerite and granite outcrops (Jeanes 2006). Associated species
include Acacia pulchella, A. saligna, Calothamnus quadrifidus, Melaleuca radula and Hakea lissocarpha. The population northwest of Gingin is in open low woodland of Eucalyptus marginata and Corymbia calophylla with an understorey of Hakea trifurcata, Bossiaea aquifolium and Hibbertia hypericoides (Hoskins 2009).

Biology and ecology

As is found in other Western Australian orchids, seed germination and seedling growth of *Thelymitra dedmaniarum* is reliant upon an interaction with symbiotic soil fungi. This association continues into adulthood. An infrequent pollinator is a beetle, a common Chrysomelid (*Diaphanops westermanni*). However, this beetle is not believed to be the main pollinator.

In establishing an experimental translocation of *Thelymitra dedmaniarum* in its natural habitat, Batty et al. (2006) found actively growing seedlings had significantly higher survival than individuals transferred as dormant tubers. In addition, no substantial benefit was observed in seedling survival of pre-inoculation of the site with the fungal endophyte. This may be a result of failure of introduced fungi to establish and whether or not the compatible fungi naturally occur at the translocation site.

Conservation status

*Thelymitra dedmaniarum* is declared as rare flora (DRF) under the Western Australian Wildlife Conservation Act 1950 and in WA is ranked as Critically Endangered (CR) under International Union for Conservation of Nature (IUCN 2001) criteria B1ab(iii,iii,v); C2a(i); D. The species is listed as Endangered (as *T. manginii*) under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act).

Threats

The main threats to the species are:

- **Weed invasion.** *Watsonia* and Cape Tulip (*Moraea* sp.) are a threat to Subpopulation 1a, and introduced grasses are a threat to most other subpopulations, particularly those located on road reserves. Weeds suppress early plant growth by competing for soil moisture, nutrients and light. They also increase the fire hazard due to the easy ignition of high fuel loads, which are produced annually by many grass weed species.
- **Grazing, digging and trampling.** Feral pigs dig through large areas of soil in search of food, damaging plants and providing habitat for weeds. Bandicoots have also dug in the area of populations. Grazing by
kangaroos has resulted in flowering heads being frequently eaten. Although grazing does not appear to kill the plants it reduces their reproductive output.

- **Road, track and firebreak maintenance.** This is a threat to Subpopulations 1h, 1g, 2c and 2d. Threats include grading, chemical spraying, construction of drainage channels and the mowing of roadside vegetation. Several of these actions also encourage weed invasion.

- **Altered fire regimes.** These may interfere with the reproductive phase of the orchid (flowering, pollination, seed growth and seed dispersal). Seedlings can be killed by inappropriate timing of fires in the first few years of growth. Due to the restricted distribution of the species and low numbers of plants it is thought that populations may be seriously impacted if burnt during the species’ active growing period between late April and early November. Fire may also facilitate weed invasion and when it occurs should be followed up with appropriate weed control.

- **Motorbikes and off-road vehicles.** These are a threat to Subpopulations 1h and 2d and may cause dissection of the habitat with eventual erosion of the edges of vegetation occurring where tracks are created. These activities increase the risk of damaging the species through trampling and may increase the spread of disease.

- **Illegal picking and trampling.** This is a threat to Subpopulations 1h and 2d which are in areas used by the general public.

- **Poor recruitment.** Factors that negatively influence reproduction, such as grazing, poor seed set and changed fire regimes may result in little or no recruitment.

- **Future mining operations.** These are a potential threat to Populations 1 and 2. Mineral extraction leases cover the sites and have the potential to severely impact habitat.

The intent of this plan is to provide actions that will deal with immediate threats to *Thelymitra dedmaniarum*. Although climate change may have a long-term effect on the species, actions taken directly to prevent the impact of climate change are beyond the scope of this plan.

Guide for decision-makers

Section 1 provides details of current and possible future threats. Actions for development and/or land clearing in the immediate vicinity of Thelymitra dedmaniarum may require assessment.

Actions that could result in any of the following may potentially result in a significant impact on the species:

- Damage or destruction of occupied or potential habitat.
- Alteration of the local surface hydrology or drainage.
- Reduction in population size.
- A major increase in disturbance in the vicinity of a population.

Habitat critical to the survival of the species, and important populations

Thelymitra dedmaniarum is ranked in WA as CR, and as such it is considered that all known habitat for wild populations is habitat critical to the survival of the species, and that all wild populations are important populations. Habitat critical to the survival of T. dedmaniarum includes the area of occupancy of populations, areas of similar habitat surrounding and linking populations (these providing potential habitat for population expansion and for pollinators), additional occurrences of similar habitat that may contain undiscovered populations of the species or be suitable for future translocations, and the local catchment for the surface and/or groundwater that maintains the habitat of the species.

Benefits to other species or ecological communities

Recovery actions implemented to improve the quality or security of the habitat of Thelymitra dedmaniarum will also improve the status of associated native vegetation. Two DRF species and seven priority flora also occur within the same bushland as T. dedmaniarum. These taxa are listed in the table below:

Table 4. Conservation–listed flora species occurring within 500m of Thelymitra dedmaniarum

</tr>
</tbody>
</table>

For a description of the Priority categories see Smith (2012).

Thelymitra dedmaniarum does not occur within or adjacent to any Threatened or Priority Ecological Communities (TECs/PECs).

International obligations

This plan is fully consistent with the aims and recommendations of the Convention on Biological Diversity, ratified by Australia in June 1993, and will assist in implementing Australia’s responsibilities under that Convention. The species is listed (as Thelymitra dedmaniae) under Appendix II in the United Nations
Indigenous consultation

A search of the Department of Indigenous Affairs Aboriginal Heritage Sites Register revealed two sites (#3536, Swan River; #3387, Wooroloo Brook) of Aboriginal significance adjacent to Populations 1 and 2 of *Thelymitra dedmaniarum*, and three sites (#20008, Gingin Brook Waggyl Site; #20749, Moore River Waugal; #21620, Chandala Brook) adjacent to Population 3 of the species. Input and involvement has been sought through the South West Aboriginal Land and Sea Council (SWALSC) and Department of Indigenous Affairs to determine if there are any issues or interests. Indigenous opportunity for future involvement in the implementation of the Recovery plan is included as an action in the plan. Indigenous involvement in management of land covered by an agreement under the *Conservation and Land Management Act 1984* is also provided for under the joint management arrangements in that Act, and will apply if an agreement is established over any reserved lands on which this species occurs.

Social and economic impacts

The implementation of this recovery plan may cause some social and economic impact. For private property Subpopulations 1a, d, f and i, this would be through the loss of land available for development, the requirement to modify land management practices and through the cost of implementing recovery actions. Subpopulations 1b, c, e, g; and 2a, b, c and d occur on land vested with or managed by the local Shire and economic impacts may be through the modification of road management practices, and implementation of recovery actions Mineral exploration leases cover the area where Populations 1 and 2 are found and there is potential for economic impact should mining be impeded or if mining operations go ahead and are affected by the proximity of these populations. Five sites of Aboriginal significance also occur in the areas of populations and recovery actions may require consideration of Indigenous interests.

Affected interests

The stakeholders potentially affected by the implementation of this plan include the City of Swan, indigenous parties, private landholders and mining tenement holders.

Evaluation of the plan’s performance

DEC, with assistance from the Swan Region Threatened Flora and Communities Recovery Team (SRTFCRT), will evaluate the performance of this plan. In addition to annual reporting on progress the plan will be reviewed and evaluated against the criteria for success and failure following five years of implementation.

2. RECOVERY OBJECTIVE AND CRITERIA

Objective

The objective of this plan is to abate identified threats and maintain or enhance *in situ* populations to ensure the long-term preservation of the species in the wild.

Criteria for success: The number of populations has increased and/or the number of mature individuals has increased by 20 per cent or more over the term of the plan.

Criteria for failure: The number of populations has decreased and/or the number of mature individuals has decreased by 20 per cent or more over the term of the plan.

3. RECOVERY ACTIONS
**Existing recovery actions**

Stakeholders have been made aware of the existence of this species and its locations. These notifications detail the current status of the species as DRF and the associated legal obligations in regards to their protection.

Declared Rare Flora (DRF) markers have been installed at Subpopulations 1b and g. These alert people working in the vicinity of populations to the presence of DRF and the need to avoid work that may damage the species or its habitat. Dashboard stickers and posters describing the significance of DRF markers have been produced and distributed to relevant Shires and other organisations.

Spot hand spraying of annual grasses (veldt and wild oats) using Fusilade® was undertaken at Population 1 in 1997, 2001 and 2002.

Between 2001 and 2003, feral pig baiting and trapping was undertaken near Population 1 by DEC with volunteer assistance. In addition, once-off hand application of 1080 rabbit baits, were distributed on all private property populations by the Department of Agriculture.

In 2002, cages were placed over *Thelymitra dedmaniarum* at Subpopulation 1a to act as a barrier to digging animals.

An information sheet for *Thelymitra dedmaniarum* (as *manginii*) was jointly produced by the former Natural Heritage Trust and DEC. The sheet contains photographs, a description of the plant, its habitat type, threats and management actions. This poster was distributed to owners of land that contains this species, to owners of land who live in close proximity to known populations and to local Shires.

In 2009, an article on the range extension of *Thelymitra dedmaniarum* appeared in *WATSNU* volume 15, issue 2 (Hoskins 2009).

The Botanic Gardens and Parks Authority (BGPA) have two fungal collections for this species in storage as part of their orchid fungal collection and two seed collections, with each vial containing 0.12mL of seed equalling approximately 2,000 seeds per vial. A further seed collection is kept in the glasshouse and contains 0.20mL of seed which is equivalent to approximately 4000 to 5000 seeds. Two live specimens are potted in the orchid nursery.

Since 1998, DEC research associate Fred Hort has undertaken extensive searches for *Thelymitra dedmaniarum*.

In 1997 BGPA undertook a research translocation of five species of temperate terrestrial orchids which included *Thelymitra dedmaniarum* (Dixon 1997). The aim of this study was to investigate the potential for field re-introductions with seedlings and dormant tubers propagated *ex situ*. Research was also carried out to detect the presence of fungi associated with translocated orchids through re-isolation from translocated orchids (Batty *et al.* 2006). Using material collected from a known population, 25 dormant tubers were planted back into the same population. For *T. dedmaniarum*, 18 per cent of plants resulting from the translocation of dormant tubers persisted after five years.

Staff from DEC Perth Hills and Swan Coastal Districts monitor all populations.

The SRTFCRT is assisting DEC to coordinate recovery actions for *Thelymitra dedmaniarum* along with other threatened species in the Region. Information on progress in implementing recovery actions will be reported through annual reports to DEC’s Corporate Executive and funding bodies.

**Future recovery actions**

Where *Thelymitra dedmaniarum* occurs on lands other than those managed by DEC, permission has been or will be sought from appropriate owners/land managers prior to recovery actions being undertaken. The
following recovery actions are generally in order of descending priority, influenced by their timing over the life of the plan. However this should not constrain addressing any of the actions if funding is available and other opportunities arise.

1. Coordinate recovery actions

The SRTFCRT will assist DEC in coordinating recovery actions for *Thelymitra dedmaniarum* along with other threatened species. Information on progress in implementing recovery actions will be reported through annual reports to DEC’s Corporate Executive and funding bodies.

**Action:** Coordinate recovery actions  
**Responsibility:** DEC (Perth Hills and Swan Coastal Districts) with assistance from the SRTFCRT  
**Cost:** $6,000 per year

2. Monitor populations

Monitoring should be undertaken and may include factors such as grazing, weed invasion, habitat degradation, hydrology, population stability (expansion or decline), pollinator activity, seed production, recruitment.

**Action:** Monitor populations  
**Responsibility:** DEC (Perth Hills and Swan Coastal Districts)  
**Cost:** $10,000 per year

3. Conduct weed control

Weeds are a threat to all populations and control is required. A weed management plan drafted for *Diplolaena andrewsii* (Bettink 2011) also covers Population 1 of *Thelymitra dedmaniarum* which is located in the same area. The following actions as per Bettink (2011) will be implemented for Population 1 of *T. dedmaniarum*:

- Liaise and support land managers in commencing, continuing and/or extending treatment of *Watsonia* in populations.
- Control infestations of priority weeds in the vicinity of Population 1.
- Map and control encroachment of Cape Tulip into Population 1.
- Following unplanned fires, implement broad scale *Watsonia* control.

The following actions will be implemented for other populations:

- Undertake mapping of invasive weeds within reserves that contain populations of *Thelymitra dedmaniarum*.
- Control invasive weeds by the most appropriate technique - herbicide, mowing or hand weeding.
- To maintain low weed levels, revegetation with site-specific species is required (in Autumn).
- Monitor and report on the effects of weed control on *Thelymitra dedmaniarum* and associated native plant species.

**Action:** Conduct weed control  
**Responsibility:** DEC (Perth Hills and Swan Coastal Districts)  
**Cost:** $6,000 per year, as required

4. Install cages and fencing where required

To prevent impacts on plants from digging, trampling and grazing, exclusion cages and/or fencing may be required for protection.

**Action:** Install cages and fencing where required
Responsibility: DEC (Perth Hills and Swan Coastal Districts)
Cost: $5,000 per year, as required

5. Control feral animals that impact on the species

Grazing by animals such as feral pigs and rabbits will be monitored and managed at all populations. If necessary, grazing will be controlled through baiting or other methods.

Action: Control feral animals that impact on the species
Responsibility: DEC (Perth Hills and Swan Coastal Districts)
Cost: $5,000 per year

6. Develop and implement a fire management strategy

Where possible, fire will be excluded from the habitat of populations (in particular fire between late April and November) except where it is being used experimentally as a recovery tool. A fire management strategy will be developed in consultation with relevant authorities and land managers that recommends appropriate fire frequency, intensity, season, and control measures.

Action: Develop and implement a fire management strategy
Responsibility: DEC (Perth Hills and Swan Coastal Districts)
Cost: $10,000 in first year and $2,000 in subsequent years

7. Manage recreational impacts at subpopulations 1h and 2d

To deter access to Subpopulations 1h and 2d barriers such as bollards or fencing may be needed. Signs indicating the significance of the area may also need to be introduced to prevent trampling.

Action: Manage recreational impacts at subpopulations 1h and 2d
Responsibility: DEC (Perth Hills District), City of Swan and Department of Planning
Cost: $10,000 in years 1 and 2

8. Undertake surveys

It is recommended that areas of potential habitat be surveyed for the presence of *Thelymitra dedmaniarum* during its flowering period. All surveyed areas will be recorded and the presence or absence of the species documented to increase survey efficiency and reduce unnecessary duplicate surveys. Where possible, volunteers from the local community, Landcare groups, the WA Native Orchid Study and Conservation Group, wildflower societies and naturalists clubs will be encouraged to become involved.

Action: Undertake surveys
Responsibility: DEC (Perth Hills and Swan Coastal Districts) with assistance from community groups
Cost: $5,000 per year

9. Ensure long-term protection of habitat

DEC will investigate the possibility of obtaining land containing populations of *Thelymitra dedmaniarum* and having it declared as reserves for conservation. Subpopulation 1h located on WAPC land is intended to eventually be transferred to the Conservation Commission.

Action: Ensure long-term protection of habitat
Responsibility: DEC (Perth Hills and Swan Coastal Districts, Land Unit); DoP and Department of Mines and Petroleum (DMP)
Cost: $3,000 per year

10. Obtain biological and ecological information
Additional information on the biology and ecology of *Thelymitra dedmaniarum* will provide a scientific basis for its management in the wild and should include research on:

1. the fungal symbiont associated with *Thelymitra dedmaniarum* and its distribution in the wild
2. seed viability and conditions necessary for germination
3. species response to disturbance such as fire
4. longevity of plants, and time taken to reach maturity, and
5. the species’ pollination biology, identification of pollinators and their habitat requirements.

<tbody>
<tr>
<td><strong>Cost:</strong></td>
<td>$10,000 per year</td>
</tr>
</tbody>
</table>

#### Collect and store seed

Preservation of genetic material is essential to guard against extinction of the species if the wild populations are lost. It is recommended that additional seed of *Thelymitra dedmaniarum* be collected and stored by BGPA along with samples of the symbiotic fungus. Collections should aim to sample and preserve the maximum range of genetic diversity possible (which should be determined by an appropriate molecular technique such as genetic fingerprinting if feasible).

<tbody>
<tr>
<td><strong>Cost:</strong></td>
<td>$5,000 per year</td>
</tr>
</tbody>
</table>

#### Liaise with land managers and indigenous communities

Staff from DEC Perth Hills and Swan Coastal Districts will liaise with land managers to ensure that populations of *Thelymitra dedmaniarum* are not accidentally damaged or destroyed. Indigenous consultation will take place to determine if there are any issues or interests in areas that are habitat for *T. dedmaniarum*.

<tbody>
<tr>
<td><strong>Cost:</strong></td>
<td>$2,000 per year</td>
</tr>
</tbody>
</table>

#### Map habitat critical to the survival of *Thelymitra dedmaniarum*

Spatial data relating to habitat critical to the survival of *Thelymitra dedmaniarum* should be determined. Although this is alluded to in Section 1, it has not yet been mapped and will be addressed under this action. If additional populations are located, habitat critical to their survival will also be determined and mapped.

</tr>
</tbody>
</table>

#### Promote awareness

The importance of biodiversity conservation and the protection of *Thelymitra dedmaniarum* will be promoted to the public. This will be achieved through an information campaign using local print and electronic media and by setting up poster displays. The current information sheet will be updated to include nomenclatural changes and will be distributed to local landowners and shires. Formal links with local naturalist groups and interested individuals will also be encouraged.

Interim Recovery Plan for *Thelymitra dedmaniarum*

Cost: $4,000 in year 1 and $2,000 in years 2-5

15. **Review this plan and assess the need for further recovery actions**

If *Thelymitra dedmaniarum* is still ranked CR at the end of the five-year term of this plan, the need for further recovery actions, or a review of this plan will be assessed and a revised plan prepared if necessary.

**Action:** Review this plan and assess the need for further recovery actions  
**Responsibility:** DEC (SCB, Perth Hills and Swan Coastal Districts) with assistance from the SRTFCRT  
**Cost:** $3,000 in year 5

4. **TERM OF PLAN**

This plan will operate from January 2013 to December 2017 but will remain in force until withdrawn or replaced. If the species is still ranked CR after five years, the need for further recovery actions will be determined.

5. **REFERENCES**

6. TAXONOMIC DESCRIPTION

**Thelymitra dedmaniarum**

Glabrous terrestrial herb. Tubers not seen. Leaf ovate-lanceolate to ovate, 5–25 centimetres long, 10–35 millimetres wide, erect or obliquely erect, blade flat, leathery, bright green to yellowish green, sheathing at base, apex subacute to acute, sometimes shortly apiculate. Scape 25–55 centimetres tall, 2–3.5 millimetres diam., slender to stout, straight, green. Sterile bracts usually 2, occasionally 3, lanceolate, 2.5–9 centimetres long, 4–10 millimetres wide, closely sheathing at base, usually green, apex often free and diverging from scrape, acuminate. Fertile bracts ovate-acuminate to obovate-acuminate, 7–35 millimetres long, 3–9 millimetres wide, sheathing the pedicels, usually green. Pedicels 1–15 millimetres long, slender. Ovary narrow-obovoid, 6–12 millimetres long, 1.5–4 millimetres wide, curved. Flowers 2–12, 28–55 millimetres across, thick-textured, golden yellow, often reddish brown towards the centre, cinnamon scented, opening freely in warm weather. Perianth segments 12–28 millimetres long, 3–10 millimetres wide, more or less flat, both surfaces sparsely covered with tiny beads-like glands, apex often slightly twisted, acute to shortly acuminate, often shortly apiculate; dorsal sepal ovate-lanceolate to lanceolate; lateral sepals ovate-lanceolate to lanceolate, asymmetric; petals ovate-lanceolate to lanceolate, asymmetric; labellum lanceolate, often somewhat smaller than other segments. Column erect from the end of ovary, 6–9 millimetres long, 5–8 millimetres wide, yellow, broadly winged, wings deeply dentate along distal margins, teeth 0.1–2 millimetres long; post-anther lobe with dorsal surface covered by a dense mass of orange trichomes (each c. 0.4 millimetres long); supra-anther lobe 2–3 millimetres long, yellow, rod-like with a swollen clavate notched apex 1–2.2 millimetres wide, 1.5–3 millimetres thick, apex rugose, ventral surface papillose at base; auxiliary lobes absent; lateral lobes digitiform, 1–2.5 millimetres long, c. 0.4 millimetres thick, fleshy, yellow, with 2 similar but slightly thinner basal lobes that are entire or, less often, divided. Anther inserted towards base of column, partly obscured behind stigma, ovoid, 5–7 millimetres long, 2–3.5 millimetres wide, connective produced into a fleshy, curved beak 2.5–3.5 millimetres long, c. 2 millimetres thick, shallowly s-shaped in profile, extending to tip of column; pollinarium 2–4 millimetres long; viscidium almost round, c. 0.6 millimetres diam.; pollinia coherent, white. Stigma situated at base of column, ovate-quadrate, 3–4 millimetres long, 3–4.5 millimetres wide, margins irregular. Capsules not seen.
